

**Description:**

The session will expire after 15 minutes after login. You can switch the application to others and switch back to work on the application within 15 minutes after that the session will expire and you have to login again by inputting the password or use TouchID. You can launch the application and let it stay without using only 15 minutes after that you have to login again. However, if you kill the application, you have to login again anyway.

**Scenarios:**

As a customer, I can stay awake without using the application within 15 minutes

As a customer, I can switch the application to other applications and go back to use the application again if it's still on 15 minutes

As a customer, I can kill the application anytime but I have to login again if I launch the application

**A list of the further testing area:**

1. If a customer land on another page on the application and then switch the application to others and go back to use the application more than 15 minutes, The application should immediately expire the session and let the customer login again anyway
2. If a customer logged in to the application on multiple devices, The application should immediately kill the session and let the customer know that they're logging in on multiple devices
